Contains	Percentage	Sowing rate
Kikuyu Coated	10%	4-5 kg/100m ²
Fine Leaf Turf Rye	80%	Hardiness 
Lawn Starter Fertiliser	10%	
		Aesthetic Quality 

Sowing your lawn

Early to mid-autumn provides optimal conditions for seeding a new lawn. With milder air temperatures and warm soil, germination is encouraged before winter.

Follow these key steps for successful seeding:

- 1. Weed Control:** Eliminate competing weeds two weeks prior to seeding using a Weedkiller.
- 2. Soil Preparation:** Sow seeds in well-drained, firm, organic-rich soil. Consider using lawn top dressing for heavy clay or poor sandy soil.

3. Measure and Calculate:

Determine the seed quantity needed by measuring the area.

- 4. Sow with Care:** Create shallow furrows in straight lines, mixing seeds with a turf starter fertiliser (included in all UMS Lawn Blends) for better germination. Broadcast evenly, cross rake, and water.

- 5. Watering Routine:** Maintain soil moisture for the first 14–21 days, watering frequently if needed. Adjust watering as the grass establishes, reducing frequency but increasing volume.
